Profile Porous Ceramic (PPC) Greens Grade

Greens Grade is an inorganic soil amendment proven on thousands of greens across the country to resist compaction, eliminate localized dry spot, drain better and facilitate healthy root systems that leave turf less prone to disease and other maintenance problems. A kiln-fired porous ceramic from a unique mineral deposit in Mississippi, Greens Grade replaces peat in any sand-based root zone

A Greens Grade particle is 74% pore space with 39% capillary (water) pores and 35% non-capillary (air) pores. Blended with sand, it increases the water and nutrient holding capabilities and the air and drainage pores—permanently improving most soils. The small-sized particle is ideal for sand-based construction and is available in two distinct colors—Natural for use in construction and topdressing, and Emerald to disguise worn areas and blend in with turf.

TURFACE Reduces Compaction Making Fields Safer

Turf ace Mvp. With its high porosity and strong angular shape fights compaction, keeping infields firm enough for solid footing yet resilient enough for safe, consistent play. Turf areas are also greatly affected by compaction. TURFACE MVP's pore space improves the exchange of water and oxygen needed to promote a healthy root system. (

Turf ace Pro League is a patented soil conditioner manufactured with smaller, more consistent particles that flow easily into aeration holes. Used as a topdressing, Pro League saves games and turf by preventing slick and muddy conditions that destroy turf and make fields unsafe and unplayable. It provides superior drainage and absorption and delivers the color, safety and performance of a Major League infield.

Turf ace Quick Dry is specifically designed to absorb infield puddles and should be used in conjunction with TURFACE MVP. TURFACE Quick Dry is the same high quality calcined clay as TURFACE MVP but sized for greater surface area to eliminate puddles instantly. Like TURFACE MVP, TURFACE Quick Dry also absorbs its weight in water, slowly releasing the moisture. This allows TURFACE Quick Dry to work over and over again as it conditions the infield surface.

Field & Fairway's medium-sized particle helps turf in native soils survive under intense traffic. When you incorporate it into the root zone, it adds porosity to prevent compaction in high traffic areas. Field and Fairway is available in two distinct colors: Natural and Emerald. Incorporate Natural into your root zone to prevent compaction and amend poor soils during renovation and construction. Use Emerald to cover up rough spots on your field, mask worn or high-traffic areas and add color and strength to turf

Moundmaster Bricks

Maximizing Performance with Minimum Maintenance

The pitcher's mound and home plate areas are the most important pieces of real estate on a baseball diamond. Unfortunately, these areas are often constructed and maintained with inferior materials that breakdown quickly, causing "pot holes" that jeopardize the safety of athletes and reduce the quality of play. **TURFACE MOUNDMASTER** is the highest quality, most durable packing clay available. Pre-formed into easy to use clay blocks,

TURFACE MOUNDMASTER installs quickly and performs superbly. Properly maintained, **MOUNDMASTER** will reduce the labor involved in caring for your pitcher's mound and batter's boxes. It is ideal when renovating or rebuilding mounds and boxes.
